Causal inference theory is important because the regression techniques now taught to young social scientists as methods of determining cause and effect assume endogeneity when the data often don't support such an assumption. They also impose a linear model on the data that can be similarly inappropriate.

In my experience, all social science researchers that I have worked with seem to treat the process of writing a paper as some kind of exercise in going “back-and-forth” between theoretical analysis and empirical evidence. Just as an example, they (we) might run X number of regressions, and try to find a fitting theory that can explain the ...
