Sodium Chloride (Dry) Sodium Chloride (dry) is a high-purity salt used in brines with a density range between 8.4 to 10.0 lb/gal (1.008 to 1.200 SG). When mixed with NaBr, densities up to 12.5 lb/gal (1.501 SG) can be achieved.

110 Scope of the Fluid Flow Manual The Fluid Flow Manual presents the equations that model basic fluid flow phenomena. Most of the equations and discussions are oriented toward solving for pressure drop given well defined fluids, flow rates, and geometry in simple hydraulic systems. In general the manual treats isothermal flow.

Composition and Properties of Drilling and Completion Fluids
fluids are so-called completion fluids that are used to finish the well after drilling is completed. The fluids used during completions are often referred to as workover and comple-tion (WOC) fluids, clear brines and/or packer fluids. Drilling fluid is a major factor in the success of the drilling program and deserves careful study.

Introduction - IADC.org
Completion fluids are brines (i.e., mixture of water with chlorides, bromides and formats) and have the proper density and flow characteristics. These fluids have a high pH content and ionic composition and are chemically compatible with the reservoir formation. Completion fluids, if used for general purposes, are very corrosive and expensive.

Clear Brine Fluids - Today, most completion fluids are designed to be solids-free or with a minimum amount of solids. To achieve the higher density fluid for deeper, more hostile environments, clear brines have been formulated using inorganic salts. These solids-free clear brines can minimize formation damage yet control reservoir pressures.
