The law of cosines requires that we know the lengths of two sides of the triangle. We are only given information about the length of one side. Write the equation to find the length of AB. $\sin 75^\circ 2.93 = \sin 23^\circ$. Find AB and round the length to the tenths place. $\sin 75^\circ 2.93 = \sin 23^\circ$.

In trigonometry, the law of sines, sine law, sine formula, or sine rule is an equation relating the lengths of the sides of a triangle (any shape) to the sines of its angles. According to the law, $a \sin A = b \sin B = c \sin C = d$,
$$\left\{\frac{a}{\sin A}\right\}, = \left\{\frac{b}{\sin B}\right\}, = \left\{\frac{c}{\sin C}\right\}, = \left\{\frac{d}{\sin D}\right\}$$

Objective. Students will practice deciding when to apply the law of cosines vs the law of sines to calculate the side length of a triangle and to calculate the measure of an angle. The second part of the sheet focuses on problems that require using the formulas more than once (law of cosines to get side, then law of sides to get angle etc..) ()

the side opposite the angle is constant for each of the three angle/side pairs within a triangle. Law of Sines: $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$. In the past, you used the sine ratio to find missing sides and angles in right triangles.

First, it only shows up if the information you are given is 2 sides and 1 angle which is opposite one of the given sides. When you write and solve the law of sines, you end up with $\sin C = 0.32$ or something. You type $\sin^{-1}(0.32)$ in your calculator and you are given an acute angle. Actually there are two solutions to the equation $\sin C = 0.32$.
