It’s where USC marine biologists completed a comprehensive new study that shows the tactics bacteria and viruses employ to gain advantages against each other. What they found is that an unlikely standoff occurs, regardless of time, season or location — proof of the evolutionary principle of the “Red Queen” hypothesis.

New study examines germ warfare between bacteria and viruses
New studies of microbiota effects on viruses should be aimed at both examining the “phenomenology” and examining mechanisms underlying effects (Figure 2) (64, 88, 89). The ideal first step for any given virus is to determine whether the microbiota promote infection, limit infection, or have no effect.

Our hands are much more hospitable to bacteria than to viruses, but you'll find a few of the latter. Most flu is transmitted through the air in virus-laden droplets propelled by coughs and sneezes. But our hands can pick up those droplets from any number of surfaces, so they're often an important link in the chain of transmission.
